Javascript cheatsheet

Item	Syntax	Description	Example
Declaring Variables var, let, const	<pre>let < var_name > = < value ></pre>	 var - global access, value can chage let - access within block where it is declared, value can change const - access within block where it is declared, value cannot change 	<pre>let i = 5; var myStr = "John"; const pi = 3.14</pre>
Strings			
length	string_obj.length	length Returns the length of the string	<pre>let myStr = "Hello"; console.log(myStr.le ngth); Output is 5</pre>
split	string_obj.split(sep arator)	split Splits the string based on the separator and returns an array.	<pre>let myStr = "Hello! How are you?"; console.log(myStr.sp lit()) Output is ['Hello!', 'How' 'are', 'you?']</pre>
charAt	string_obj.charAt(in dex)	charAt returns the character at a specified index in a string. Index starts at 0 ends at length-1	<pre>let myStr = "Hello"; < console.log(myStr.ch arAt(0)) Output is H</pre>
replace	string_obj.replace(" SearchValue","NewVal ue")	replace searches a string for a specified value, or a regular expression, and returns a new string where the specified values are replaced.	<pre>let myStr = "Hello User"; console.log(myStr.re place("User","World")); Output is Hello World</pre>
substring	<pre>string_obj.substring (start, end)</pre>	substring is used to extract characters, between to indices from the given string, and returns the substring. It excludes the last index	<pre>let myStr="Hello"; console.log(myStr.su bsting(1,4)); Output is ell</pre>
startswith	string_obj.startsWit h(searchvalue)	startsWith returns true if a string begins with a specified string, otherwise false	<pre>let myStr="Hello from the other side"; console.log(myStr.st artsWith("Hello")); Output is true</pre>

endsWith	<pre>string_obj.endsWith(searchvalue))</pre>	endsWith returns true if a string ends with a specified string, otherwise false	<pre>let myStr="Hello from the other side"; console.log(myStr.st artsWith("side")); Output is true</pre>
toUpperCase	<pre>string_obj.toUpperCa se()</pre>	toUpperCase converts a string to uppercase letters	<pre>let myStr="hello"; console.log(myStr.to UpperCase()); Output is HELLO</pre>
toLowerCase	<pre>string_obj.toLowerCa se()</pre>	toLowerCase converts a string to lowercase letters	<pre>let myStr="HELLO"; console.log(myStr.to UpperCase()); Output is hello</pre>
concat	string_obj.concat(st ring1, string2,,stringN)	concat joins two or more strings.	<pre>let myStr="Hello"; let str="World"; console.log(myStr.co ncat(str)); Output is HelloWorld</pre>
Arrays			
push	arr_name.push(value)	push adds new items to the end of an array.	<pre>let myArr=["Hello"]; myArr.push("World"); console.log(myArr); Output is ["Hello","World"]</pre>
pop	arr_name.pop()	pop removes the last element of an array.	<pre>let myArr= ["Hello","World"]; myArr.pop(); console.log(myArr); Output is ["Hello"]</pre>
length	arr_name.length	length sets or returns the number of elements in an array.	<pre>let myArr= ["Hello", "World"]; console.log(myArr.le ngth); Output is 2</pre>
indexOf	<pre>arr_name.indexOf(ite m)</pre>	indexOf searches for a specified item and returns its position.	<pre>let myArr= ["Hello","World"]; console.log(myArr.in dexOf("World") Output is 1</pre>
lastIndexOf	arr_name.lastIndexOf (item)	lastIndexOf returns the last index (position) of a specified value.	<pre>let myArr= ["Hello", "World", "He llo"]; console.log(myArr.la stIndexOf("Hello"); Output is 2</pre>

,,,		-5	,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,
entries	arr_name.entries()	entries Returns and Array Iterator that helps you to iterate through the array and recieve each entry as an array of two elements containing the key and the value, where in the key is the index position of the element and value is the element itself.	<pre>const hello = ["h", "e", "l", "l","o"]; console.log(hello.en tries()); Output is Object [Array Iterator] {}</pre>
find	Array.find(<arreleme t="">=>{ //return boolean based on a condition }</arreleme>	find Finds the first occurance of an element in the array which returns true on checking the condition	<pre>//Find the first string with s let myarr = ["Mercury", "Venus"," Earth", "Mars"]; let found = myarr.find(val=>{ return val.includes("s"); }) console.log(found); Output Venus</pre>
filter	Array.filter(<arrele met="">=>{ //return boolean based on a condition }</arrele>	filter Finds the all occurances of elements in the array which returns true on checking the condition	<pre>//Find the all strings with s let myarr = ["Mercury", "Venus", " Earth", "Mars"]; let found = myarr.filter(val=>{ return val.includes("s"); }) console.log(found); Output [Venus,Mars]</pre>
map	Array.map(<arrelemet>=>{ //return processed value }</arrelemet>	map Processes the all elements of the array which returns a new processed array of same size	<pre>let myarr = ["name", "place", "thi ng", "animal"]; let found = myarr.map(val=>{ return val+"s"; }) console.log(found); Output ['names', 'places', 'things', 'animals']</pre>
concat	<pre>arr_nameconcat(arr 1.name);</pre>	concat concatenates (joins) two or more arrays.	<pre>let hello = ["hello", "world"]; let lorem = ["along", "lorem"] let h = hello.concat(lorem); console.log(h); Output is ["hello", "world", "along", "lorem"]</pre>
Мар			
set	mapName.set(key,valu e);	set helps you define a new element with akey and its value	<pre>var newMap = new Map(); newMap.set("h", 1); console.log(newMap); Output is {"h" => 1}</pre>

		searching for	<pre>Map();</pre>
			<pre>newMap.get("h");</pre>
			<pre>console.log(newMap);</pre>
			Output is {"h" => 1}
keys	<pre>mapName.keys();</pre>	get is used to get all of the keys associated with the	var newMap = new
		mapName	Map();
			<pre>newMap.set("h",1);</pre>
			newMap.set("i",2);
			console.log(newMap.k
			eys());
			Output is {"h", "i"}
values	<pre>mapName.values();</pre>	values is used to get all of the values to the keys	var newMap = new
		associated with the mapName	Map();
			<pre>newMap.set("h",1);</pre>
			newMap.set("i",2);
			console.log(newMap.v
			alues());
			Output is {1,2}
has	mapName.has(key_name	has is used to check if the key passed resides in the	var newMap = new
);	map or not, and returns true or false	Map();
			<pre>newMap.set("h",1);</pre>
			newMap.set("i",2);
			console.log(newMap.
			as(i));
			Output is true
delete	mapName.delete(key_n	delete is used to delete the key and the value from	var newMap = new
	ame);	the map	Map();
			<pre>newMap.set("h",1);</pre>
			<pre>newMap.set("i",2);</pre>
			<pre>newMap.delete("h");</pre>
			console.log(newMap)
			Output is {"i" => 2}
JSON			
Create JSON	let varname=	JSON is a dictionary Object with Key-Value pairs.	<pre>let myjson1={}; let</pre>
	<pre>{name1:value1,name2:</pre>		myjson2 =
	values2,}		{"name":"Jennifer",
			age":"32"}
Add entry to JSON	let jsonObj[<key>]=</key>	Adds an entry to JSON Object mapping the key to	<pre>let myjson1 = {};</pre>
	<value></value>	value	myjson1["name"]="Jas
			on";
			console.log(myjson1
			;

Arithmetic	<pre><0perand1> <0perator> <0perand2></pre>	+ addition - subtration / division * multiplication % modulus(gives remainder) ++ increment by 1 decrement by 1	<pre>let num1 = 2; let num2 = 2; console.log(num1+num 2); console.log(num1- num2); console.log(num1/num 2); console.log(num1*num 2); console.log(num1*num 2); console.log(num1%num 2); num1++; console.log(num1); num2; console.log(num1); Output is 4 0 1 4 0 3 3</pre>
Logical	condition1 && condition2 condition1 condition2 ! condition1	&& (AND)is used to check if all the operand conditions are true (OR)is used to check if either of the operand condition are true ! (NOT) is used to check if the operand condition is not met	<pre>let num1 = 12, num2 = 2; console.log(num1>10 && num2>10); console.log(num1>10 num2>10); console.log(! (num1==num2)); Output is false true true</pre>
Assignment	<pre>variable = value variable += incremental value variable -= decremental value %= modulus value /= divide value *= multiply value</pre>	 a=b assigns the value of b to a a+=b adds the value of b to a and stores it in a a-=b subtracts the value of b from a and stores it in a a%=b divides the value of a by b and stores the remainder in a a/=b divides the value of a to b and stores the quotient in a a*=b multiplies the value of a and b and stores the value in a 	<pre>let num1 = 12, num2 = 2; console.log(num1=num 2); console.log(num1+=nu m2); console.log(num1- =num2); console.log(num1/=nu m2); console.log(num1*=nu m2); console.log(num1*num 2); console.log(num1*num 2); console.log(num1=num 2); console.log(num1=num 2);</pre>
Loops			
For Loop	<pre>for(initialization;c ondition;increment/d ecrement){ //code block }</pre>	for loops throughout the block of code a number of times making sure the condition is satisfied	<pre>for(let num = 0 ; num <=5 ; num++){ console.log(num) } Output is 0 1 2 3 4 5</pre>
while	while(condition){ //code block }	while itrates through the block of code while a specified condition is true	<pre>let num1 = 0; let num2 = 5; while(num1 < num2){ console.log(num1) num1++; }</pre> Output is 0 1 2 3 4

```
do while
                                                    do while loops throughout the block once before
                          do{ //code block }
                                                                                                        let num = 5; do {
                                                    checking condition.
                          while(condition)
                                                                                                        console.log(num);
                                                                                                        num--; }
                                                                                                        while(num > 0)
                                                                                                        Output is 5 4 3 2 1
for in
                                                    for in is used to itrate through the specific
                          for (var in object)
                                                                                                        let arr =
                          { //code block
                                                    property/type of the object
                                                                                                        ["a", "b", "c"];
                          }
                                                                                                        for(let i in arr) {
                                                                                                        console.log(arr[i]);
                                                                                                        }
                                                                                                        Output is a b c
Conditional statements
if
                          if(condition){
                                                    if a specified condition is true, a block of code will
                                                                                                        let num = 5; if(num
                                                    be executed
                          //code Block... }
                                                                                                        = 5){
                                                                                                        console.log(true); }
                                                                                                        Output is true
if-else
                          if(condition){

                                                                                                        switch(num) { case
                                                    within the switch statement.
                          //code break; case
                                                                                                        1:
                          <value2>: //code
                                                                                                        console.log("Hello
                          break: .
                                                                                                        world!"); break;
                          default: //default
                                                                                                        case 2:
                          code block }
                                                                                                        console.log("Hi");
                                                                                                        break; default:
                                                                                                        console.log("this is
                                                                                                        default"); }
                                                                                                        Output is Hi
Other useful operations
                          typeof(operand)
                                                    typeof operator returns a string indicating the type
                                                                                                        console.log(typeOf("
typeof
                                                    of the unevaluated operand
                                                                                                        Hello")) Output is
                                                                                                        "string"
```

isNaN	isNaN(operand)	isNaN determines whether a value is anythying but a number or not. It returns false for a number	console.log(isNaN("Hello")) Output is true
parseInt	parseInt(string, radix)	parseInt is a function that parses a string argument and returns an integer of the specified radix.(radix is a base)	<pre>//0011 is 3 for binary, since binary only has 2 numbers 0, 1 the radix is 2 console.log(parseInt ("0011", 2)); //Default parseInt takes decimal system console.log(parseInt ("54")); Output is 3 54</pre>
parseFloat	parseFloat(string)	parseFloat is a function that parses a string argument and returns an float	parseFloat("3.14") Output is 3.14
